The average increase in temperature, $t, t,$ is found by multiplying the volume of the heated hollow sphere by its mean increase in temperature and dividing by the volume of the whole drop. The volume heated is equal to the section of the diagram of the heated hollow sphere multiplied by the surface of that sphere, which contains the centre of gravity of this diagram. ---g-= $0-215(9(8-2 \times 0-2r,)V. Columns 6-12 give, for sheets of water, jets and drops of $8 = 1-7$ mm. thickness or diameter respectively, the mean increase in temperature of the whole mass in the times given, for each 1 difference in temperature. It is clearly seen from this Table 46 that the greatest transference of heat takes place at the...$$
